**Finish:**  
**Drill:**  
**Misc Info: 8-page color Booklet 4/4 saddle stitched 32# digital**

**Persistent Posture-Perceptual Dizziness (PPPD) (Functional Dizziness)** 

Dizziness is a common symptom in neurology and has lots of different causes.

There are lots of different causes of dizziness - migraine, middle ear problems (vestibular disorders - like BPPV or labyrinthitis) - and drug side effects are all common ones.

Dizziness occurring as part of a functional disorder is also relatively common accounting for up to 20% of patients seen in a specialist dizziness clinic. When dizziness occurs as a functional disorder it is called

**'Persistent Postural-Perceptual Dizziness' (PPPD) or Chronic Subjective Dizziness.**

Other names for it include Visual Vertigo, Public Postural Vertigo, Functional Dizziness or Space and Motion Discomfort.

PPPD has recently been defined by the World Health Organisation as

"Persistent non-vertiginous dizziness, unsteadiness, or both lasting three months or more.

Symptoms are present most days, often increasing throughout the day, but may wax and wane. Momentary flares may occur spontaneously or with routine movement.

Affected individuals feel worst when upright, exposed to moving or complex visual stimuli, and during active or passive head motion. These situations may not be equally provocative.

Typically, the disorder follows occurrences of acute or episodic vestibular or balance-related problems. Symptoms may begin intermittently, and then consolidate."

FACTSHEET
