

McLaren Print System Order

Order No: 6141
 Order Date: 2014-09-29
 User: Angela DeLaRosa
 Phone: 3720 Katalin Ct, Suite 201 (989) 893-9705

Ship Location: McLaren Bay Region Family Medicine/Attn Angela DeLaRosa
 3720 Katalin Ct
 Bay City, MI 48706

Forms
 Quantity: 100
 Paragon Dept No: 69000
 Dept Name: McLaren Medical Group
 Company Number: 810

Order Total Price: 0.00

Form Number: DCH-1237
 Form Description: Live Attenuated Influenza Vaccine Information Statement
 Revision Date: 8/19/2014
 Print: 2 sided black and white
 Paper: 20# White Text
 Size: 8.5 x 11
 Fold:
 Finish:
 Drill: None

VACCINE INFORMATION STATEMENT	
<h2>Influenza Vaccine</h2> <p>What You Need to Know</p>	<p>(Flu Vaccine, Live, Intranasal) 2014-2015</p> <p><small>Read This Vaccine Information Statement and Family's Record card and sign them before vaccination. There is information and important information on the inside of the vaccine information statement. It is written in the Spanish language.</small></p>
<p>1 Why get vaccinated?</p> <p>Influenza ("flu") is a contagious illness that spreads around the United States every winter, usually between October and May.</p> <p>Flu is caused by influenza viruses, and is spread mainly by coughing, sneezing, and close contact.</p> <p>Anyone can get flu, but the risk of getting flu is highest among children. Symptoms come on suddenly and may last several days. They can include:</p> <ul style="list-style-type: none"> • fever/chills • sore throat • muscle aches • fatigue • cough • headache • runny or stuffy nose <p>Flu can make some people much sicker than others. These people include young children, people 65 and older, pregnant women, and people with certain health conditions – such as heart, lung or kidney disease, nervous system disorders, or a weakened immune system. Flu vaccination is especially important for these people, and anyone in close contact with them.</p> <p>Flu can also lead to pneumonia, and make existing medical conditions worse. It can cause diarrhea and nausea in children.</p> <p>Each year thousands of people in the United States die from flu, and many more are hospitalized.</p> <p>Flu vaccine is the best protection against flu and its complications. Flu vaccine also helps prevent spreading flu from person to person.</p>	<p><i>Injectable flu vaccines are described in a separate Vaccine Information Statement.</i></p> <p>Flu vaccination is recommended every year. Some children 6 months through 9 years of age might need two doses during one year.</p> <p>The viruses are always changing. Each year's flu vaccine is made to protect against viruses that are likely to cause disease that year. LAIV protects against 4 different influenza viruses. Flu vaccine cannot prevent all cases of flu, but it is the best defense against the disease.</p> <p>It takes about 2 weeks for protection to develop after vaccination, and protection lasts several months to a year.</p> <p>Some illnesses that are not caused by influenza virus are often mistaken for flu. Flu vaccine will not prevent these illnesses. It can only prevent influenza.</p> <p>LAIV may be given to people 2 through 49 years of age. It may rarely be given at the same time as other vaccines.</p> <p>LAIV does not contain thimerosal or other preservatives.</p>
<p>2 Live, attenuated flu vaccine—LAIV, Nasal Spray</p> <p>You are getting a live, attenuated influenza vaccine (called LAIV), which is sprayed into the nose.</p> <p>"Attenuated" means weakened. The viruses in the vaccine have been weakened so they won't give you the flu.</p> <p>There are other "inactivated" and "recombinant" flu vaccines that do not contain live virus. These "flu shots" are given by injection with a needle.</p>	<p>3 Some people should not get this vaccine</p> <p>Tell the person who gives you the vaccine:</p> <ul style="list-style-type: none"> • if you have any severe, life-threatening allergies, including (for example) an allergy to gelatin or antibiotics. If you ever had a life-threatening allergic reaction after a dose of flu vaccine, or have a severe allergy to any part of this vaccine, you should not get vaccinated. • if you ever had Guillain-Barre Syndrome (a severe paralyzing illness, also called GBS). Some people with a history of GBS should not get this vaccine. This should be discussed with your doctor. • if you have long-term health problems, such as certain heart, breathing, kidney, liver, or nervous system problems; your doctor can help you decide if you should get LAIV.
